

Digital Asset Management

Manage, store, secure, access, search & share all digital assets from anywhere, anytime with cloud-based, software-driven digital asset management (DAM).

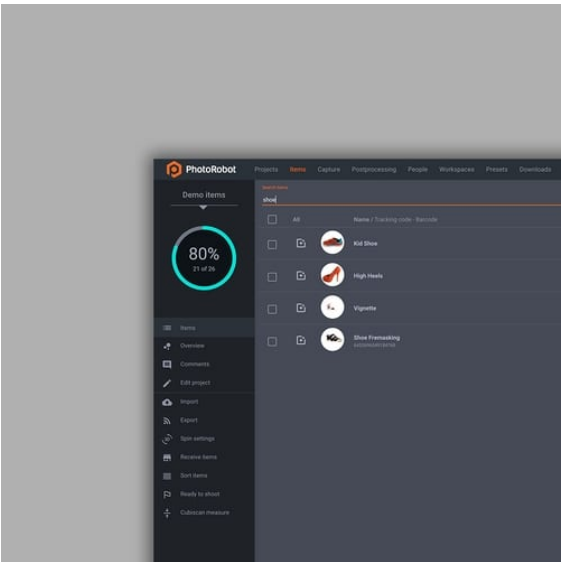

Unlimited secure storage

Unlimited and Reliable Storage for ALL Your Product Content

Take advantage of multi-regional deployment with disaster recovery. All data is stored in ISO 27001 and secured via Google Cloud, with access only via TLS-encryption. Regular audits ensure the highest levels of security possible by today's industry standards.

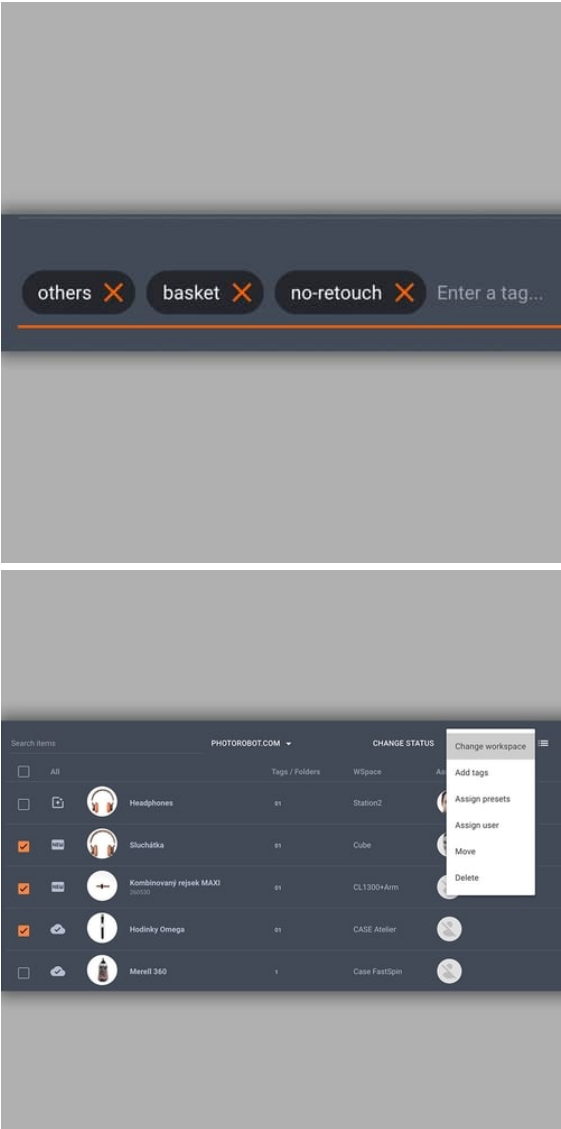

Full-Text Search

Easily navigate between Projects, Items, Folders, Clients & Users, with expanded, conditional search queries for Items & Item Statuses. Team members can easily find tasks they're responsible for, progress on photoshoots, items for editing, review and more.

Categorization

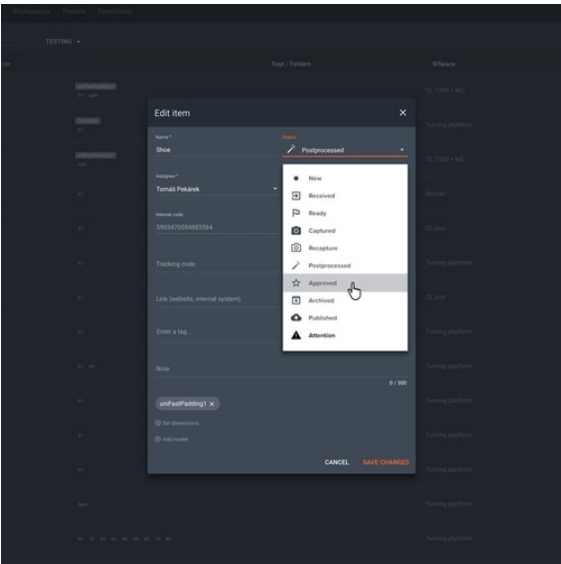

Categorize data with various tags for digital asset management. Search all tags via Full-Text Search, or by simply clicking the tag itself.

Bulk Operations

Perform actions across multiple items at once thanks to Cloud processing. Bulk operations run in the background, meaning all editing parameters can be applied while photographing additional products. Usually, an entire batch of images takes approximately 1 minute to post-process, although times vary depending on the complexity of operations. Nonetheless, neither speed nor productivity is compromised, ensuring optimal studio workflow.

Collaboration

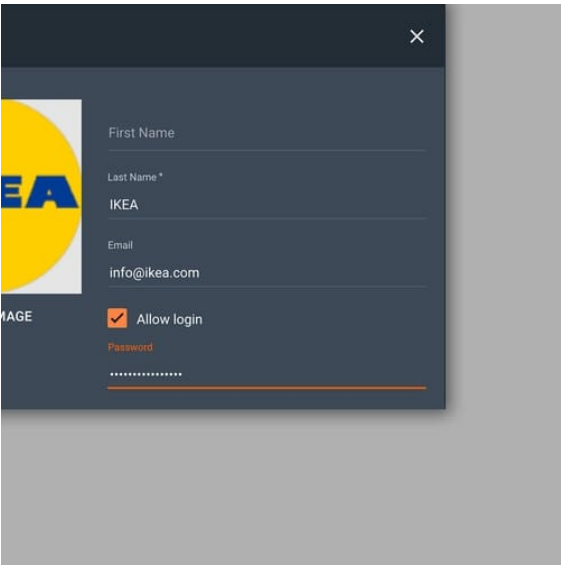

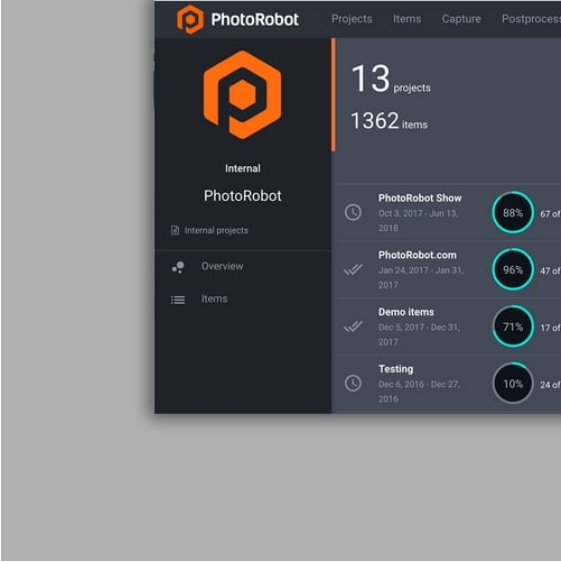

Approval Process

An integrated approval process within the application makes review & approval possible for both internal and external team members or clients. Studio managers and quality assurance teams can approve work internally. Meanwhile, all external parties need are log-in permissions for easy access of data and external approval.

Client Page

Provide clients their own personal page for a quick overview of projects, items, and item statuses.

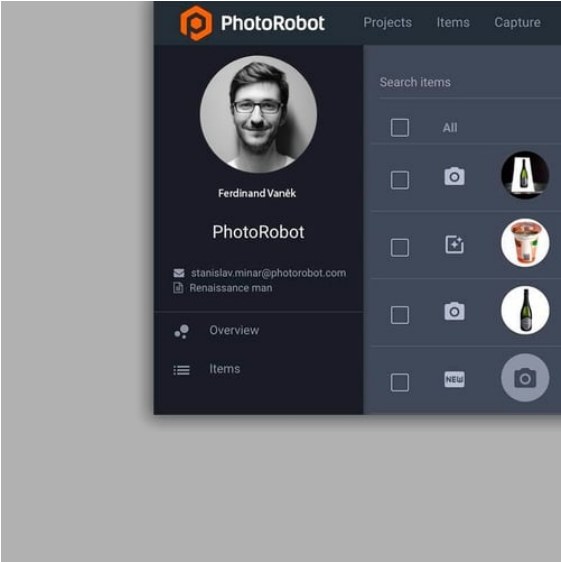

Grant Access to Clients

Grant clients access to digital assets in just a few simple clicks. Check 'Allow Login', enter a password, and clients will see completed tasks when items or folders are set to 'Verified'. Clients can then approve or reject changes, or attach feedback and instructions for additional retouching.

Photographer Page

Ensure photographers / accounts have all their assignments, projects and items readily available thanks to individual photographer account pages. These provide a quick overview of projects, with easy search & navigation as well as item statuses to communicate workflows & completed production.

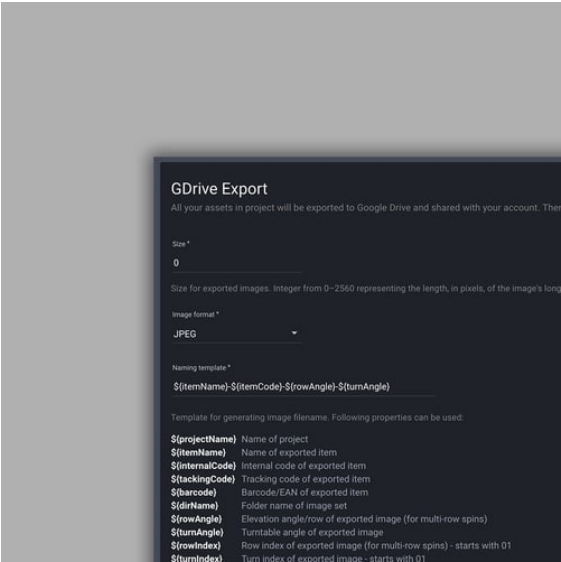

Integration

Easily integrate with e-commerce export feeds. JSON and XML formats are available on the level of the project, organization or client. Meanwhile, all items are in computer-readable format. Set properties such as: Name, ID, SKU, Status, Timestamp & more.

Bulk Image Export

Fetch images in required quality, filename structure, format and resolution within the application or via a standalone export utility. All it takes is a single click by a user or client to download the latest images on their site.
