We had the chance to try one of the most advanced facial scanning technologies in the world that is usually used to digitize Hollywood actors for and turn them into photorealistic 3D models for visual effects: the light stage. Our reporter even got to scan herself and learned how digital humans are created.

The light stage capture system at the Institute of Creative Technologies at the University of Southern California (USC) in Los Angeles was developed by computer scientist Paul Debevec.

A big thanks to the team at ICT (Hao Li, Owen Ingraham, Kalle Bladin, Xinglei Ren) for letting us try the light stage!

Funny Cat Videos Motive

Here at [Funny Cat Videos](#), we take funny cat videos seriously, so when it came time for us to determine what videos would do a lazy day justice, we had some pretty stringent parameters. Our picks needed to have insanely good replay value. They needed to have relatable characters and stories easy enough to invest in that even someone hunkered-down with the flu could still enjoy what s going on. And lastly, longer cat movies, Cute Cats, Funny cats, Funniest Cats Compilation and funny animal videos took priority in our research, for obvious reasons (read: time consumption).
